2 SUMMARY

2.1 GENERAL REMARKS:

The EUT is a 2.4 GHz – transceiver remote control unit for low power data transmission in 3 channels of the operating band of 2.4 GHz to 2.4835 GHz MHz and has an integrated printed antenna.

A temporary connector can not be implemented due to the small size of the module. A suitable test fixture can also not be used to convert radiated measurements to conducted measurements therefore all measurements were performed radiated.

Items	Description
Transceiver Chip	TI CC253364
Power type	3 VDC (2 AAA Batterys)
Modulation	OQPSK
Data rate	250 kbps
Frequency range	2400 MHz to 2483.5 MHz
Channel spacing	25 MHz
Channel numbers	3
Antenna type	Inverted F antenna (PCB)

Channel	Frequency [MHz]
1	2425
2	2450
3	2475

3.4 Short description of the equipment under test (EUT)

The EuT is a Remote control unit for TV set top boxes and operate in the frequency band from 2400 MHz to 2483.5 MHz.

Number of tested samples: 1
Serial number: Prototype

EUT operation mode:

The equipment under test was operated during the measurement under the following conditions:

- cont. TX at CH1, CH2 and CH3 (2425 MHz, 2450 MHz and 2475 MHz)

- standby / cont. RX mode

-

EUT configuration:

4 TEST ENVIRONMENT

4.1 Address of the test laboratory

mikes-testingpartners gmbh
Ohmstrasse 2-4
94342 STRASSKIRCHEN
GERMANY

4.2 Environmental conditions

During the measurement the environmental conditions were within the listed ranges:

Temperature: 15-35 ° C

Humidity: 30-60 %

Atmospheric pressure: 86-106 kPa

4.3 Statement of the measurement uncertainty

The data and results referenced in this document are true and accurate. The reader may notice that tolerances within the calibration of the equipment and facilities may cause additional uncertainty. The measurement uncertainty is calculated for all measurements listed in this test report acc. to CISPR 16-4-2 „Uncertainties, statistics and limit modelling – Uncertainty in EMC measurement“ and documented in the mikes-testingpartners gmbh quality system acc. to DIN EN ISO/IEC 17025. For all measurements shown in this report, the measurement uncertainty of the test laboratory, mikes-testingpartners gmbh, is below the measurement uncertainty as defined by CISPR. Therefore, no special measures must be taken into consideration with regard to the limits according to CISPR. Furthermore, component diversity and modifications in production processes may result in additional deviation. If necessary, refer to the test lab for the actual measurement uncertainty for specific tests. The manufacturer has the sole responsibility of continued compliance of the EUT.

4.4 Measurement protocol for FCC and IC

4.4.1 General information

4.4.1.1 Test methodology

Conducted and radiated disturbance testing is performed according to the procedures set out by the International Special Committee on Radio Interference (CISPR) Publication 22, European Standard EN 55022 as shown under section 1 of this report.

The Open Area test site is a listed Open Site under the Canadian Test-Sites File-No:

IC 3009A-1

In compliance with RSS 210 testing for RSS compliance may be achieved by following the procedures set out in ANSI C63.4 and applying the CISPR 22 limits.

4.4.1.2 Justification

The equipment under test (EUT) is configured in a typical user arrangement in accordance with the manufacturer's instructions. A cable is connected to each available port and either terminated with a peripheral using the appropriate impedance characteristic or left unterminated. Where appropriate, cables are manually manipulated with respect to each other thus obtaining maximum disturbances from the unit.

4.4.1.3 Details of test procedures

The test methods used comply with CISPR Publication 22, EN 55022 - "Information technology equipment - Radio disturbance characteristics - Limits and methods of measurement" and with ANSI C63.4 - "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". In compliance with 47 CFR Part 15 Subpart A, Section 15.38 testing for FCC compliance may be achieved by following the procedures set out in ANSI C63.4 and applying the CISPR 22 limits.

4.5 Determination of worst case measurement conditions

Measurements have been made in all three orthogonal axes. The worst case results are written down in the respective parts of this test report.

5 TEST CONDITIONS AND RESULTS

5.1 Conducted emissions

For test instruments and accessories used see section 6 Part A 4.

5.1.1 Description of the test location

Test location: NONE

Remarks: Not applicable because the EuT is battery powered.

FCC ID: XYN2745

IC ID: 8748A-2745

5.2 Radiated emission of the fundamental wave

For test instruments and accessories used see section 6 Part CPR 3.

5.2.1 Description of the test location

Test location: Anechoic chamber 2
Test distance: 3 m

5.2.2 Photo documentation of the test set-up

5.2.1 Applicable standard

According to FCC Part 15C, Section 15.249(a):

The field strength of emissions from intentional radiators operated within these frequency bands shall comply with the effective limits.

5.2.2 Description of Measurement

The radiated emission of the fundamental wave from the EUT is measured using a spectrum analyser and appropriate linear polarized antennas. The set up of the EUT and the measurement procedure is in accordance to ANSI C63.4, Item 8.3. The EUT is measured in TX continuous mode modulated under normal conditions.

Test setup 18 GHz – 40 GHz

5.3.3 Applicable standard

According to FCC Part 15C, Section 15.249 (d):

Emission radiated outside of the specified frequency bands, except harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated limit in FCC Part 15C, Section 15.209, whichever is the lesser attenuation.

5.3.4 Description of Measurement

The radiated emissions from the EUT are measured in the frequency range of 9 kHz to 1000 MHz using a tuned receiver and appropriate broadband linearly polarized antennas. The setup of the EUT and the measurement procedure is in accordance to ANSI C63.4, Item 8.3. In the frequency range above 1 GHz a spectrum analyser is used with appropriate linear polarized antennas. If the emission level in peak mode complies with the average limit testing is stopped and peak values will be reported, otherwise, the emission is measured in average mode again and reported. The EUT is measured in TX continuous mode modulated under normal conditions.

For test instruments and accessories used see section 6 Part MB.

5.4.1 Description of the test location

Test location: AREA4

5.4.2 Photo documentation of the test set-up

5.4.3 Applicable standard

According to FCC Part 15, Section 15.215(c):

Intentional radiators operating under the alternative provisions to the general emission limits, as contained in Section 15.217 through Section 15.257, must be designed to ensure that the 20 dB bandwidth of the emission is contained within the frequency band designated in the rule section under which the equipment is operated.

5.4.4 Description of Measurement

The bandwidth is measured at an amplitude level reduced from the reference level by a specified ratio of -20 dB (99%). The x-dB-down (OBW) function of the analyser is used. The measurement is performed with normal modulation in TX continuous mode.

Spectrum analyser settings:

RBW: 100 kHz

VBW: 300 kHz

80% bandwidth of the permitted band:

66.8 MHz

Maximum frequency drift under extreme conditions: 33.3 kHz

Limit according to FCC Part 15C, Section 15.215(c):

If frequency stability is not specified in the regulations, it is recommended that the fundamental emission be kept within the central 80% of the permitted band in order to minimize the possibility of out-of-band operation.

The requirements are **FULFILLED**.

Remarks: For detailed test result please refer to following test protocols.

The OBW99 is measured for RSS only.

To show the compliance under frequency stability, the EuT was tested under extreme voltage and temperature conditions. Due to the fact of the small frequency drift, the measurement where only performend at the worst case conditions.

For test instruments and accessories used see section 6 Part DC.

5.5.1 Description of the test location

Test location: Shielded Room S4

5.5.2 Photo documentation of the test set-up

5.5.3 Applicable standard

According to FCC Part 15A. Section 15.35(c):

When the radiated emission limits are expressed in terms of average value and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete puls train, including blanking intervals, as long as the pulse train does not exceed 0.1s. In cases where the puls train exceeds 0.1s, the measured field strength shall be determined from the average absolute voltage during a 0.1s interval during which the field strength is at its maximum. The exact method of calculating the average field strength shall be submitted.

5.5.4 Description of Measurement

The duty cycle factor (dB) is calculated applying the following formula:

Paring mode:

$$KE = 20 \log ((t_{iw}/T_w) * (t_{iB}/T_B)) = 20 \log ((0.813*12)/100) = \underline{\underline{-20.2 \text{ dB}}}$$

Operation mode:

$$KE = 20 \log ((t_{iw}/T_w) * (t_{iB}/T_B)) = 20 \log ((0.813*2)/100) = \underline{\underline{-35.8 \text{ dB}}}$$

KE: pulse operation correction factor
t_{iw}: pulse duration for one complete pulse track
t_{iB}: pulse duration for one pulse
T_w: a period of the pulse track
T_B: a period of one pulse

5.5.5 Test result

Paring mode:

Duty cycle	<i>t_{iw}</i> (ms)	<i>T_w</i> (ms)	<i>t_{iB}</i> (ms)	<i>p</i>	<i>KE</i> (dB)
Within 100 ms	-	100	0.813	12	-20.2 (max. -20 dB)

Operation mode:

Duty cycle	<i>t_{iw}</i> (ms)	<i>T_w</i> (ms)	<i>t_{iB}</i> (ms)	<i>p</i>	<i>KE</i> (dB)
Within 100 ms	-	100	0.813	2	-35.8 (max. -20 dB)

Remarks:

The pulse train (*T_w*) exceeds 100 ms. Therefore the duty cycle have been calculated by averaging the sum of the pulse widths over the 100 ms width with the highest average value.

Each data packet was calculated with a maximum length of 813 μs (worst case condition).

The maximum correction is limited to 20 dB.

5.6 Antenna application

5.6.1 Applicable standard

According to FCC Part 15C. Section 15.203(a):

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this Section.

Remarks: The EUT use an integrated PCB antenna. No other antenna than that furnished by the
responsible party or external power amplifier can be applied by a customer.
The antenna of the EUT meets the requirement of FCC Part 15C. Section 15.203 and 15.204.

5.7 Receiver radiated emissions

For test instruments and accessories used see section 6 Part **SER2** and **SER3**.

5.7.1 Description of the test location

Test location: OATS 1
Test location: Anechoic chamber 2
Test distance: 3 m

5.7.2 Photo documentation of the test set-up

Test setup 30 MHz – 1000 MHz

Test setup 1 GHz – 18 GHz

5.7.3 Applicable standard

According to FCC Part 15C, Section 15.109(a):

Except for Class A digital devices, the field strength of radiated emissions from unintentional radiators at a distance of 3 m shall not exceed the given limit.

5.7.4 Description of Measurement

The radiated emissions from the EUT are measured in the frequency range of 9 kHz to 1000 MHz using a tuned receiver and appropriate broadband linearly polarized antennas. In the frequency range above 1 GHz a spectrum analyser is used with appropriate linear polarized antennas. The set up of the EUT will be in accordance to ANSI C63.4. If the emission level in peak mode complies with the average limit then testing will be stopped and peak values of the EUT will be reported, otherwise, the emission will be measured in average mode again and reported. During the test, the EUT was set into continuous transmitting mode, modulated.

Instrument settings:

30 MHz – 1000 MHz: RBW: 120 kHz
1000 MHz – 40 GHz RBW = VBW: 1 MHz
